Acknowledgements

This working paper presents research conducted under CIFOR's Climate Change and Forests in the Congo Basin: Synergies between Adaptation and Mitigation (COBAM) project. The project, launched in 2010, is funded by the African Development Bank in support of the Economic Community of Central African States, through the framework of the Congo Basin Ecosystems Conservation Support Programme.

We would like to thank our independent consultants — Martial Gapia in CAR, Brice Severin Pongui in the Republic of Congo, Jean-Claude Ndong in DRC,

Louis-Bernard Cheteu, Dr. Maurice Tsalefack and Youssoufa Bele in Cameroon — for their support in data collection.

We would also like to thank Dr. Denis Sonwa and Alba Saray Pérez Terán for their valuable comments, Mrs. Flore Ndong and the entire COBAM team for their availability, and Fidele Giacomo and Eugene Chia whose careful proofreading helped improve this report considerably. We are grateful to all the informants for their openness and willingness to participate.

Executive Summary

In the face of climate change, two main types of strategies — mitigation and adaptation — have emerged and are now widely recognized. Mitigation aims to reduce the sources or enhance the sinks of greenhouse gases, and adaptation addresses the impacts of climate change on societies and ecosystems.

Adaptation is gaining importance in the international arena, whereas at the national level, particularly in developing countries, adaptation policies and projects are having difficulty emerging. Mitigation, on the other hand, has received both international and national attention in the past few years (particularly REDD+ strategies), however, while some countries are in the process of developing national strategies for REDD+ under the UNFCCC, others such as those in the Congo Basin face limited experience and capacity to do so.

Many authors argue the importance of mainstreaming adaptation–mitigation links into climate change policies to optimize co-benefits, create new opportunities and design more efficient projects. The forestry sector provides a range of opportunities for linking these two strategies, but few large-scale projects have documented these. Thus, there is a growing need for concrete information on national processes linked to climate change, and on the status and challenges of mitigation (including REDD+) and adaptation projects on the ground.

This report presents the progress of projects and initiatives that promote adaptation and REDD+ in the Congo Basin region and analyzes opportunities

for synergies or trade-offs between the two strategies. Ninety-four national programs and activities related to REDD+ and 11 on adaptation have been identified in six countries of the Congo Basin. The emerging landscape of climate change projects is complex and mainly rooted in historical approaches. Opportunities for funding exist but are not seized; most of the projects are at an early stage with more emphasis on REDD+ than on adaptation due to uncertainties about spatiotemporal patterns of risk occurrence and a lack of clear adaptation solutions. Other reasons are linked to insufficient political support or lack of interest in the issue among project managers. Adaptation initiatives are diffuse in development approaches and do not benefit from a structured national framework as REDD+ does.

Among REDD+ initiatives, we identify two main tendencies. On the one side, local demonstration activities directly aim to reduce carbon emissions from deforestation and forest degradation, improve sustainable forest management and increase carbon stocks. On the other side, readiness activities are developing to create an enabling framework for countries to participate in REDD+ deals and develop strategies accordingly. Adaptation to climate change and REDD+ evolve as two parallel and similar processes. Potential for synergies between the two processes exist but are not fully recognized yet. Thus transformational change is needed to increase the integration of adaptation and mitigation in the current climate portfolio. In particular, there is a need for tools, information and knowledge to support decision makers in harmonizing climate policies.

Résumé

Face au changement climatique, deux principaux types de stratégies sont apparues et sont reconnues. Alors que l'atténuation vise à réduire les sources ou à renforcer les puits de gaz à effet de serre, l'adaptation aborde les impacts du changement climatique sur les écosystèmes et les sociétés. Au niveau international, l'adaptation et l'atténuation sont associées à des processus politiques différenciées. Même si l'adaptation gagne en importance sur la scène internationale, les projets et les politiques nationales ont des difficultés à émerger dans les pays en développement. En outre, les forêts et les communautés forestières sont rarement prises en considération dans les débats et les politiques sur l'adaptation. Par ailleurs, les pays du bassin du Congo ont des expériences limitées sur la réduction des émissions par le biais de déforestation et la dégradation évitées (REDD+). Bien que le secteur forestier présente des possibilités de synergie entre adaptation et atténuation, très rares expérimentations grandeur nature peuvent le confirmer.

Ce rapport présente l'état d'avancement des projets et des initiatives visant à promouvoir l'adaptation et REDD+ dans la région du Bassin du Congo et analyse les possibilités de synergies ou de compromis entre les deux stratégies. 94 programmes nationaux et activités de terrain liées à la REDD+ et 11 sur l'adaptation ont été identifiées dans les six pays du Bassin du Congo. Le paysage émergent des projets sur le changement de climat est assez complexe et est principalement enraciné dans les approches historiques. Des possibilités de financement existent mais ne sont pas saisis ; la plupart des projets sont à

un stade précoce avec plus d'emphase sur la REDD+ que sur l'adaptation, en raison des incertitudes sur les modèles spatio-temporels d'occurrence du risque et le manque de solutions d'adaptation claires. D'autres raisons sont liées au manque de soutien politique ou au manque d'intérêt pour la question parmi les gestionnaires de projets. L'adaptation aux changements climatiques est plutôt diffuse dans la démarche de développement et ne bénéficie pas d'un cadre structurant national comme dans le cas de la REDD+.

Parmi les initiatives de la REDD+, nous identifions deux tendances principales. D'un côté, il y a les activités de démonstration locales qui visent directement à réduire les émissions de carbone dues à la déforestation et la dégradation des forêts, la gestion durable des forêts et à l'accroissement des stocks de carbone. De l'autre côté, les activités de préparation se multiplient pour tenter de créer un cadre propice à la participation des pays à la REDD+ et à l'élaboration des stratégies en conséquence. L'adaptation aux changements climatiques et la REDD+ évoluent comme deux processus parallèles et similaires. Le potentiel de synergies entre les deux processus existe mais ne sont pas encore pleinement reconnues. Ainsi les changements transformationnels sont nécessaires pour augmenter les synergies entre l'adaptation et l'atténuation dans le portefeuille des politiques climatiques actuelles. En définitive, il y a un besoin en outils, informations et connaissances pouvant aider les décideurs à harmoniser les politiques climatiques.

1 Context

1.1 Introduction

Two main types of strategies — mitigation and adaptation — have emerged and are now widely recognized as critical to addressing climate change. While mitigation aims to reduce the sources or to enhance the sinks of greenhouse gases, adaptation addresses the impacts of climate change on societies and ecosystems.

Forestry and agriculture provide a range of opportunities for linking the two strategies, with projects in both sectors playing an important role in mitigation and adaptation (Locatelli et al. 2011). In the forestry sector, for example, afforestation, reforestation and avoided deforestation projects aim to absorb or maintain carbon stock (mitigation). These projects also protect or enhance local ecosystem services, which can reduce societies' vulnerability to climate change (adaptation). Similarly, adaptation projects, particularly those that focus on forest ecosystem management, contribute to the resilience of both communities and forest ecosystems while also ultimately contributing to mitigation.

Adaptation is gaining importance in the international arena, whereas at the national level, particularly in developing countries, adaptation policies and projects are having difficulty emerging. Moreover, in debates on national adaptation policy, forests and forest communities are rarely taken into consideration (Bele et al. 2011). Regarding mitigation, while some countries are in the process of developing national strategies for reducing emissions from deforestation and forest degradation (REDD+) under the United Nations Framework Convention on Climate Change (UNFCCC), others such as those in the Congo Basin face limited experience and capacity in REDD+ implementation (Dkamela 2011). However, subnational governments and local stakeholders (municipalities, private property owners, indigenous groups, nongovernmental organizations (NGOs), etc.) have high expectations regarding the potential of REDD+ mechanisms to promote forest conservation and bring sustainable development activities to communities (Peach Brown et al. 2011).

Although the forestry sector appears to present opportunities for synergies between adaptation and

mitigation, few large-scale projects have documented these. Many authors argue the importance of mainstreaming adaptation–mitigation links into forest or climate change policies (e.g. Klein et al. 2005; Locatelli et al. 2011) to optimize co-benefits, create new opportunities and design more efficient projects. Thus, there is a growing need for concrete information on national processes linked to climate change, and on the status and challenges of mitigation (including REDD+) and adaptation projects on the ground. Given the uncertainties about international negotiations within the UNFCCC, one of the general approaches adopted is “learning by doing”, where the experiences acquired by implementing these activities help to draw lessons that can be implemented later.

The primary goal of this report is to document REDD+ and adaptation processes. More specifically, the report focuses on activities in the countries of the Congo Basin. The Congo Basin forest is the second largest tropical forest in the world covering 227 million ha. Its potential for climate change mitigation is considerable, with estimates of it storing more than 30 billion metric tons of carbon (de Wasseige et al. 2009). It also directly supports the livelihoods of 60 million people by providing a source of fuel, food, medicines and shelter, and acting as a safety net during crises and emergencies (Angelsen and Wunder 2003). As with other tropical forests, the Congo Basin forest is under threat of deforestation and degradation — approximately 0.17% of it was lost annually from 2000 to 2005 (Ernst et al. 2013) — as well as the negative impacts of climate change, which bring economic, social and environmental losses (Seppälä et al. 2009).

This report provides an overview of ongoing REDD+ and adaptation activities in the countries of the Congo Basin. It aims to address the following questions:

- What is the current progress of REDD+ and adaptation processes in the Congo Basin?
- What is the structure of actual climate change responses?
- What are the potential synergies between the two processes?

- Particularly among REDD+ projects and initiatives, what are the potential opportunities and challenges for implementing adaptation?

1.2 REDD+ and adaptation projects and initiatives: The issue of definition

The growing attention on REDD+ and adaptation to climate change is associated with fast emerging landscapes of projects and initiatives. Diverse types of support, funding, activities and programs are being developed by a multitude of actors such as bilateral and multilateral agencies, NGOs, research centers and private sector organizations. Therefore, it is important to clarify what constitutes REDD+ and adaptation projects, the purpose of each and the context in which each were developed.

REDD+ activities can be broadly defined as any activity with a global objective to reduce deforestation and forest degradation and enhance carbon stock in forest ecosystems. Despite the uncertainties about the final architecture of a global REDD+ agreement, it is generally acknowledged that many countries will not be ready for its complete implementation and thus a progressive approach is necessary (Figure 1). In the first phase, countries formulate national plans and develop infrastructure. Many large programs, such as the multilateral

UN-REDD Programme and the Forest Carbon Partnership Facility (FCPF) of the Worldbank, provide assistance to develop these plans. In the second phase, defined priorities such as supporting activities and pilot projects are implemented (REDD+ readiness activities). At the local level, **demonstration activities** support the national context and help to frame national strategies. They do so by demonstrating feasibility, setting up enabling conditions for REDD+ demonstration projects, and helping to evaluate the potential benefits and pitfalls of REDD+. These interactions between local and national initiatives are important because of countries' limited experience with REDD+. Most countries in central Africa are now in the first phase of implementing demonstration activities.

In the case of adaptation, there is no global agreement about what constitutes an adaptation measure or project. However, generally **adaptation** is understood as any process or measure that aims to reduce the vulnerability of human, natural or artificial systems to current and future climatic risks. We can divide the implementation of national adaptation projects into three phases similar to those of REDD+: preparation, inclusion in development strategies and implementation (Lim et al. 2004) (Figure 1). As adaptation spans many national economy sectors and is interlinked with other development issues, the main objective of **adaptation**

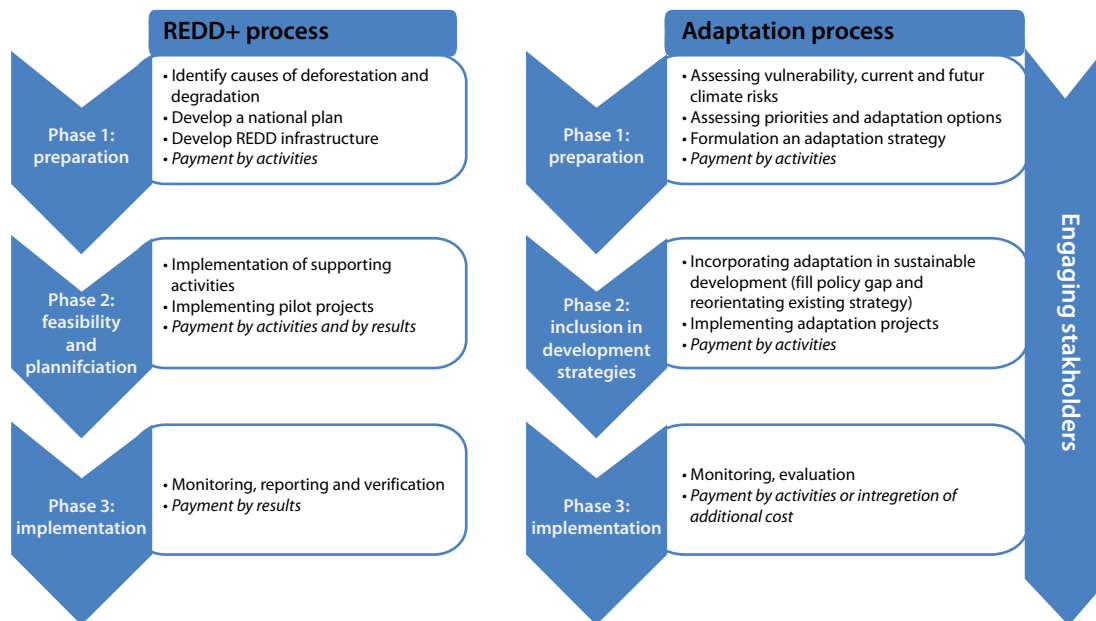

Figure 1. The three phases of implementation for REDD+ and adaptation projects.

Adapted from: Lim et al. 2004; Proforest 2011.

measures and policies is to integrate current and future climate risk in business-as-usual development policies. Contrary to the carbon market, there is no standardized measure to assess the anticipated negative impacts avoided by an adaptation project.

In this report we categorize projects and initiatives using the following definitions:

- **REDD+ readiness activities.** This refers to “measures and mechanisms that are necessary to establish an enabling framework for REDD+ deals. These can include land tenure reforms, effective enforcement of land use laws and regulations, and the establishment of systems to reliably monitor, report, and verify forest emissions” (Wertz-Kanounnikoff and Kongphan-apidak 2009, 1). It can also include research, awareness raising, capacity building, mobilization of stakeholders in the area of baseline scenarios and monitoring, reporting and verification (MRV), political economy, governance, institutions, community rights, livelihoods, participation and financing REDD+ (Wertz-Kanounnikoff and Kongphan-apidak 2009).
- **REDD+/carbon forest demonstration activities.** These activities aim to reduce the deforestation and forest degradation trends in a limited area. They have explicit carbon targets that are met either by reducing forest emissions or increasing carbon uptake, and greenhouse gas emission reductions are valorized through a compensation mechanism based on results. Many current activities conducted at the local level are not yet directly addressing deforestation drivers or are not responding to all the requirements of a REDD+ project (such as MRV systems, leakages and co-benefits). Therefore some of the REDD+ activities can be seen as preparation activities for future REDD+ projects that could enter in a global carbon deal (IUCN 2011).
- **Adaptation initiatives.** This refers to initiatives that support national adaptation strategies and policies. For example, they can include impacts and vulnerability assessments, identification of country priorities, planning for adaptation, implementing large adaptation programs, monitoring and evaluating adaptation interventions, and capacity building.
- **Activities for demonstration of adaptation.** These activities aim to reduce the vulnerability of local populations to climate change and

variability, and to set up concrete adaptation strategies. Generally they aim to increase local adaptive capacity, reinforce or diversify livelihoods and reduce the sensitivity of production systems.

1.3 Methodology

This study is based on a comparative analysis of the current state of initiatives and activities in six countries of the Congo Basin: Cameroon, Central Africa (CAR), Republic of Congo, Democratic Republic of Congo (DRC), Equatorial Guinea and Gabon. Data was collected from October 2011 to February 2013, using information available in the public domain (i.e. the Internet, brochures and project documents) and other review studies. The result is a compilation of initiatives and activities that describe the landscape of climate change policies and the level of implementation in the Congo Basin for relevant actors such as governments, investors, UNFCCC country negotiators and civil society.

Subnational projects as well as national and international initiatives relevant to REDD+, such as the World Bank’s FCPF and the United Nations Collaborative Programme on Reducing Emissions from Deforestation and Forest Degradation in Developing Countries (UN-REDD Programme), are presented. Projects and activities were classified according to the definitions described in Section 1.2. In particular, for REDD+ activities a carbon goal must have been made explicit and for adaptation activities references to climate must have been made in the project objectives.

The activities presented are not exhaustive of all initiatives due to several limiting factors. First, there is an absence of official databases and initiatives are often not easily identified. Projects are also rapidly evolving and updated information on their progress is not always available or is difficult to gather. In addition, adaptation projects are often diffuse among business-as-usual development projects, and many projects incorporate adaptation without explicitly mentioning it. There is also little information about whether development or environmental projects respond to the requirements of adaptation or whether planned changes to the orientation of projects will incorporate climate issues or REDD+ and adaptation initiatives and activities.

2 REDD+ and adaptation initiatives and activities

2.1 International initiatives for adaptation and mitigation

This section presents an overview of national processes within the UNFCCC framework, as well as broad international initiatives supporting most of the adaptation and mitigation activities on the ground. UNFCCC framework

In 1992 the UNFCCC was established to tackle the issues of global warming and climate change. It constitutes one of the main frameworks on mitigation and adaptation strategies in each country for defining priorities and funding. Adaptation received attention after the UNFCCC's Conference of the Parties 7 (COP7) in 2001, with the establishment of three funds mainly dedicated to adaptation (Huq 2002): the Least Developed Countries Fund (LDCF), the Special Climate Change fund (both created under the UNFCCC) and the Adaptation fund (created under the Kyoto Protocol). A few years later, REDD+ became a critical component of national and international strategies for mitigating global climate change and after the Bali Action Plan was agreed at COP in 2007, dedicated research programs, funding mechanisms and a whole spectrum of activities flourished to support the REDD+ process. Within the framework of the UNFCCC, countries are encouraged to develop national strategies and policies. In addition, the UNFCCC provides funding and assistance to developing countries for initial assessment and formulation of adaptation and mitigation priorities through the submission of national formatted documents.

UNFCCC related initiatives

Other international initiatives also contribute to defining adaptation and mitigation priorities. For example:

- **National communication.** Each non-Annex I Party of the Kyoto Protocol shall submit its initial communication within three years of the entry into force of the Convention for that party. The Global Environment Facility (GEF) as an operating entity of the financial mechanism of the Convention, provides financial assistance in accordance with guidance

of the COP to non-Annex I Parties through its implementing agencies (i.e. United Nations Development Programme (UNDP), United Nations Development Programme (UNEP) and the World Bank). Some bilateral agencies also provide financial and technical assistance to non-Annex I Parties in preparing their national communications. These documents define priorities for adaptation and mitigation in each country based on an assessment of the sources and sinks of greenhouse gas, an analysis of potential impacts of climate change, and a description of possible measures to reduce greenhouse gas emissions and adapt to future threats.

- **National Adaptation Programmes of Action (NAPA).** “After international recognition that LDCs [least developed countries] are among the most vulnerable to the impacts of climate change, NAPAs were established during the 2001 Conference of Parties of the United Nations Framework Convention on Climate Change in Marrakesh (UNFCCC 2002). With the NAPAs, the LDCs identify and communicate their most urgent adaptation needs, and prioritize actions to respond to them” (Pramova et al. 2012, 2). The development of the NAPAs is also intended to build capacity by raising awareness and enhancing preparedness among the institutions, sectors and communities involved. If requested, the LDC expert group and GEF implementing agencies assist national teams during this process.
- **Readiness Plan Idea Note (R-PIN) and Readiness Preparation Proposal (R-PP).** In addition to the UNFCCC framework, countries participating in the FCPF Readiness Mechanism are encouraged to submit strategy documents known as R-PIN and R-PP. Preparation of these documents guides countries in defining and setting a road map, a budget and a calendar for achieving readiness to implement REDD+. The documents constitute a synthesis of current policies, governance context, studies and preparatory activities, and modalities of implementation of activities.

The figure 2 presents the progress of each Congo Basin country in these initiatives, as measured by

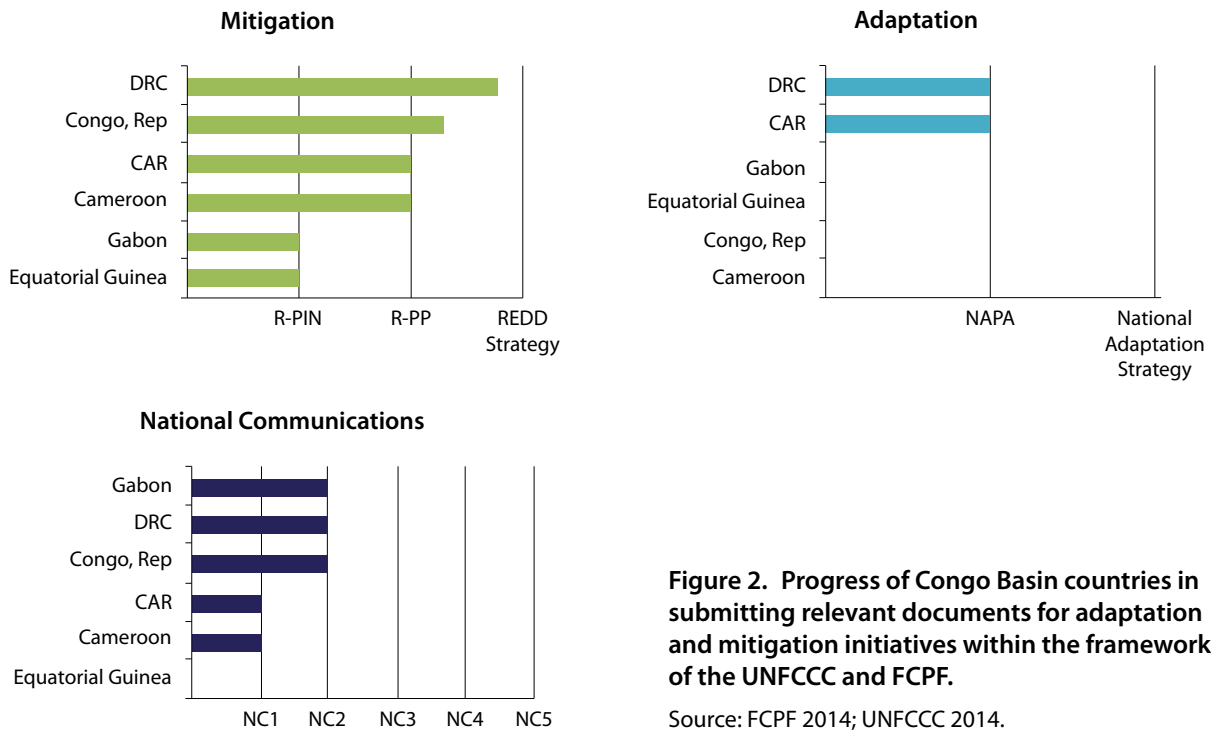

Figure 2. Progress of Congo Basin countries in submitting relevant documents for adaptation and mitigation initiatives within the framework of the UNFCCC and FCPF.

Source: FCPF 2014; UNFCCC 2014.

the submission and approval of relevant documents. The documents only encourage countries to engage in mitigation or adaptation processes and are therefore in no way binding. They do not ensure concrete policy implementation but reveal initial government engagement in climate change policies. Most documents are still under development, such as the NAPA in Cameroon and the first National Communication in Equatorial Guinea. Gabon was the first country of the Congo basin to validate its R-PIN. Subsequently, the country abandoned the classic process (as indicated by the darker color in the mitigation barplot in Figure 2) to adopt a country-specific climate scheme in which REDD+ is no longer an autonomous process but rather an element of a holistic mitigation strategy called the National Climate Plan (Van Gisbergen and Bollen 2013).

Other international and bilateral climate initiatives and funding

Other broad international initiatives are also assisting countries to engage in the mitigation and adaptation process, particularly in the forestry sector. In response to the need for additional large-scale efforts, finance for adaptation and mitigation in developing countries, through bilateral or multilateral partnerships, has rapidly emerged. These initiatives generally aim to support large programs in countries, increase capacity building, provide multistakeholder exchange platforms and finance specific activities.

Their role is particularly important in Phase 1 and Phase 2 of REDD+ preparation. They mainly constitute national comprehensive programs and funding sources for readiness activities and on-the-ground pilot projects. Table 1 lists examples of sources of international financing for both mitigation and adaptation initiatives.

Table 1 shows that the amount of pledged and disbursed funding for adaptation at the international level has caught up with funding for mitigation. This is likely due to an increase in policy attention to adaptation. However distribution of the funds varies between countries. Figure 3 shows the amount of approved funds in the Congo Basin countries for adaptation, mitigation that does not include forestry, and mitigation in the form of REDD+ or REDD+-related projects.

Congo Basin countries capture most of the REDD+ funding available but few adaptation or non-REDD+ mitigation projects have been developed. In particular, DRC has accessed a number of climate funds due to its large forest area and environmental degradation challenges. The Congo Basin Forest Fund (CBFF) is the most active fund in the country, with almost USD 40 million approved for projects that range from pilot REDD+ projects to agroforestry and forest resource management.

Figure 3. Funding approved for adaptation and mitigation in countries of the Congo Basin in 2013.

Source: Climate Fund Update 2013.

Given the multiplicity of international finance mechanisms available for REDD+ activities and adaptation, financing for forestry projects has been difficult to coordinate resulting in inconsistent processes. Even if there is a large gap in the current scale of climate finance to fully address the additional cost generated by climate change, it should not be denied that opportunities for adaptation exist in Central Africa. However, these opportunities are yet to be seized. There are several possible reasons for this: project holders face many difficulties in designing and implementing adaptation projects due to uncertainties about spatio-temporal patterns of risk occurrence; the lack of clear adaptation solutions; the high transaction costs of small-scale projects often required in poor areas; insufficient political support; and negligence of the issue amongst project managers. In Section 2.2 and 2.3, we present in more detail the projects and initiatives that are currently developed in the countries of the Congo Basin.

2.2 REDD+ initiatives, activities and projects in the Congo Basin

Large-scale initiatives

A few large-scale programs are available for countries in the Congo Basin to design national strategies and support readiness activities:

- **FCPF.** The FCPF, implemented by the World Bank, is a global partnership focused on REDD+. The FCPF assists tropical- and subtropical-forest countries to develop the systems and policies for REDD+, and provides them with performance-based payments for emission reductions. The FCPF complements the UNFCCC negotiations
- **REDD+ Partnership.** The REDD+ Partnership serves as an interim platform for its partner countries to scale up actions and finance for REDD+ initiatives in developing countries. The Partnership is considered as interim as it will be expected to be replaced by, or folded into, a UNFCCC mechanism including REDD+ once established and agreed upon by the Parties. It was created in 2010 during the International Conference on the Major Forest Basins.
- **UN-REDD Programme.** The UN-REDD Programme was launched in September 2008 to assist developing countries prepare and implement national REDD+ strategies, and builds on the convening power and expertise of the Food and Agriculture Organization of the United Nations (FAO), UNDP and UNEP. It has 53 partner countries.
- **CBFF.** The CBFF was launched in June 2008 with a grant of GBP 100 million from the governments of the UK and Norway. The aim of the CBFF is to support innovative ideas that will develop the capacity of people and institutions in the Congo Basin to manage their own forest resources, assist communities in creating and fostering sustainable livelihoods, and reduce the overall rate of forest degradation and destruction. The overall goal of the CBFF is to alleviate poverty and address climate change through reducing the rate of deforestation.
- **Forest Investment Program (FIP).** FIP is a program of the Strategic Climate Fund (a multidonor Trust Fund within the framework of the Climate Investment Funds), implemented by development multilateral Banks including the

Table 2. Participation of Congo Basin countries in international initiatives linked to REDD+.

Country	FCPF	REDD+ Partnership	UN-REDD Programme	CBFF	FIP

a The national program helps to support the development and implementation of national REDD+ strategies.

b Partner countries are engaged with the global UN-REDD Programme in a number of ways including as observers to the Programme's Policy Board, and through participation in regional workshops and knowledge sharing, facilitated by the Programme's interactive online workspace.

African Development Bank. The main purpose of FIP is to support developing countries' REDD+ efforts. It provides bridging finance for readiness reforms and investments identified through national REDD+ readiness strategy building efforts, while taking into account opportunities to help countries adapt to the impacts of climate change on forests and to contribute to multiple benefits such as biodiversity conservation and rural livelihoods enhancements.

Table 2 summarizes participation of each country in these large-scale REDD+ initiatives and the amount of funding approved. The DRC currently has the most partnerships, all with similar objectives, as it has been identified as a priority country by many support programs.

Mitigation and REDD+ readiness activities

In the six Congo Basin countries, 48 REDD+ readiness activities were identified (Annex 1). They either cover multiple countries (regional or worldwide initiatives) or are implemented at the national level. Some of them are part of bigger initiatives and can be interlinked. Figure 4a summarizes the key elements addressed in the 48 projects for the implementation of national REDD+ mechanisms. The relatively high number of initiatives for MRV activities highlights the importance of this element; it is often seen as one of the necessary conditions for developing a payment by results mechanism. Other important topics include: the preparation of a REDD+ mechanism itself such as building or reinforcing dedicated institutions; designing a national strategy and finance mechanism; and the preparation for international negotiations.

Figure 4. (a) REDD+ topics covered by the 48 readiness activities in the Congo Basin. (b) Types of activities implemented by the 48 readiness activities in the Congo Basin.

The remaining topics focus on structural reforms that would insure the success, effectiveness or equity of the REDD+ projects on the ground. They concern the sustainable management of forests and their links with local livelihoods, the participation of different stakeholders, community rights and land tenure issues, governance, and policy reforms in the economic sectors linked to deforestation.

Readiness activities mainly rely on capacity building as shown in Figure 4b. Other types of activities implemented in the readiness activities include analysis and research, multistakeholder dialogues, institutional support, coordination, technology transfer, technical assistance on the ground, support for policy design, research and education, and advocacy. The broad spectrum of activities reveals the gaps still to be addressed to reach Phase 3 and full implementation of the REDD+ process.

REDD+ projects on the ground

Across the Congo Basin countries, 46 on-the-ground projects were identified. They present varying degrees of clarity in their description of REDD+ objectives.

The projects can be categorized into four types:

- **REDD+ projects that are valorized on the carbon market or through REDD+ standards.** The projects in this category were those that presented at least a defined baseline scenario and quantification of emission reductions (even if at preliminary stage), and

activities in implementation and/or contacts already established with investors to sell the project's credits.

- **Potential REDD+ projects** that have an explicit objective to reduce deforestation and forest degradation but have not complied with carbon standards and monitoring, or have adopted an **alternative payment scheme** (such as Payments for Ecosystem Services (PES)).
- **REDD+ projects in preparation** that are still in an **exploratory stage** or have just developed baseline studies.
- **Other forestry mitigation projects** that aim to reduce carbon emissions in the forestry sector but do not comply with the REDD+ definition.

The distribution of these projects is shown in Figure 5. Very few projects have reached the stage of valorization through carbon markets, credits or certified standards. This can be explained by the procedural barriers and complexity of implementing such processes. Most of the projects present some potential to become a REDD+ project but would require, for example, a reorientation in the design of the project, clarification of the project limits and/or a better assessment of leakage effects or additionality. DRC has the most on-the-ground REDD+ projects as it was one of the first countries to receive support for the implementation of the UN-REDD Programme and has engaged with REDD+ policies since 2009. In contrast, in Equatorial Guinea

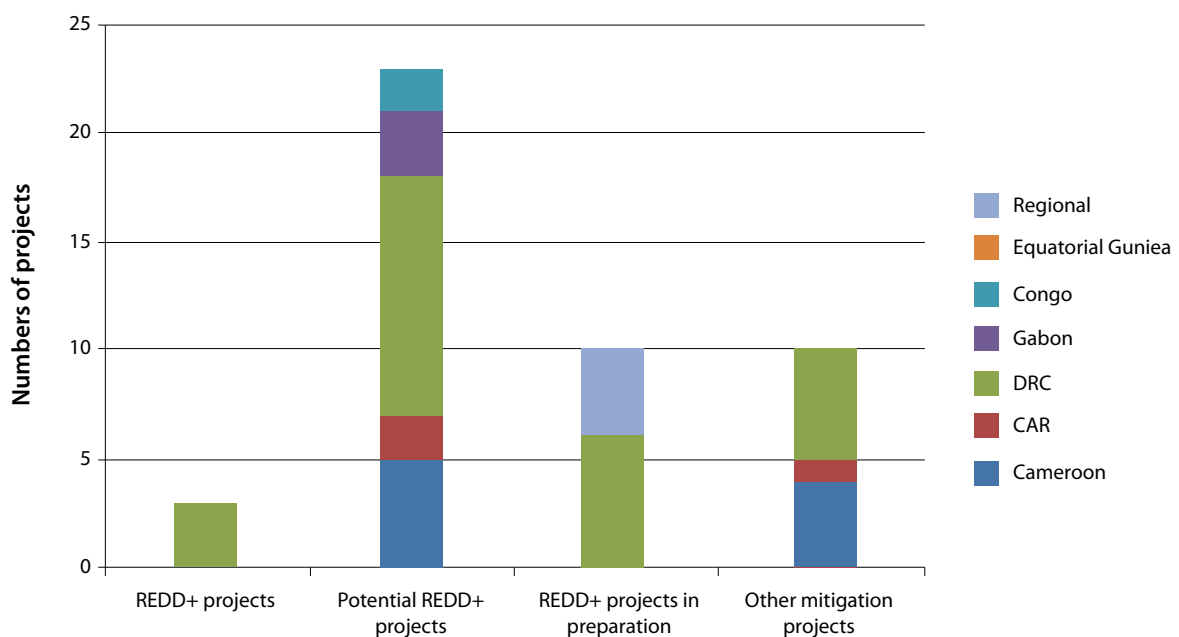

Figure 5. The number of REDD+ and REDD+-related projects in Congo Basin countries.

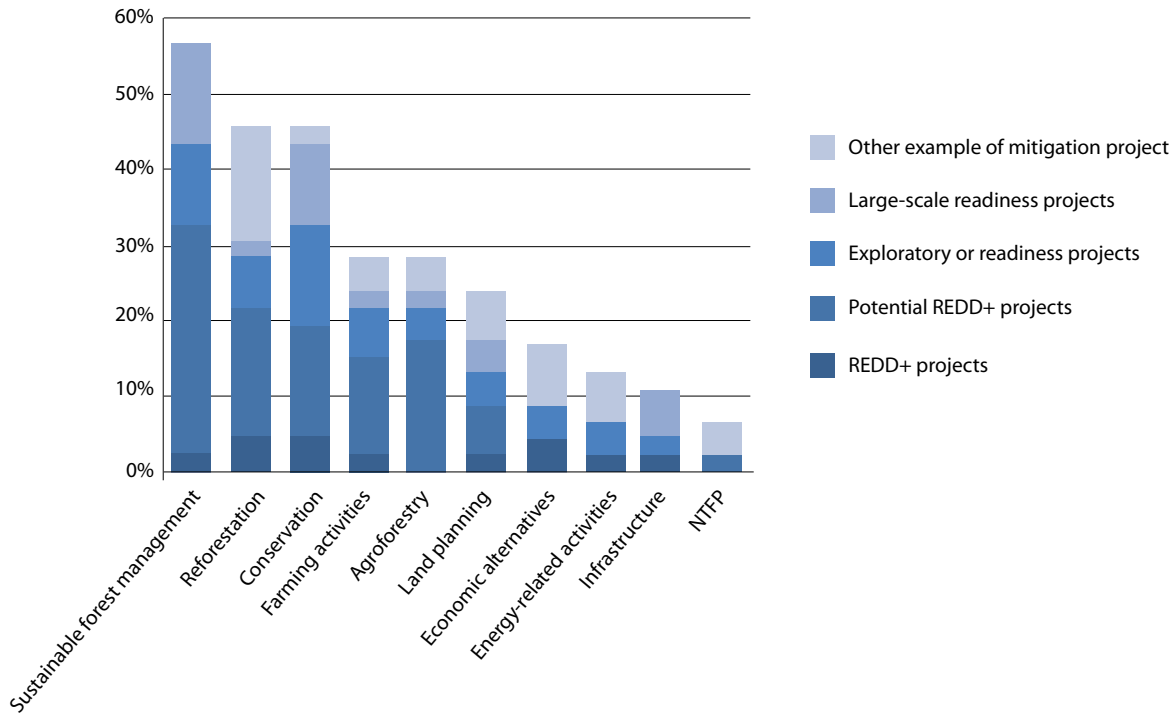

Figure 6. Number of projects with a focus on a specific activity categorized by type of mitigation project.

Note: NTFP = non-timber forest product, SFM = sustainable forest management.

REDD+ remains embryonic and has not been targeted as a political priority by the government. The absence of on-the-ground REDD+ projects reflects this position.

Figure 6 presents the types and percentage of projects that develop or plan to develop activities related to REDD+. Most are focused on forest management or conservation activities, as well as alternative farming activities.

2.3 Adaptation initiatives and projects

National initiatives

A few adaptation initiatives exist for supporting countries to develop financing capacities and manage adaptation projects with a view of long-term planning. Most aim to support informed decision-making by assessing climate impacts and vulnerability, and therefore increasing the capacity of authorities. They also support action on the ground, mainly focusing on education, training and raising awareness. The main adaptation programs targeting national policy and planning in the Congo Basin include the following:

- **Implementation of NAPAs.** The LDCE, executed by GEF, supports a work program that assists LDCs carry out the preparation and implementation of NAPAs. As of December 2011, the LDCE has approved USD 217 million for projects and mobilized more than USD 919 million in co-financing. In the Congo Basin, only DRC and CAR benefit from this fund.
- **Africa Adaptation Programme (AAP).** The AAP was launched in 2008 by the UNDP in partnership with the United Nations Industrial Development Organization, the United Nations Children’s Fund and the World Food Programme and with USD 92.1 million from the Government of Japan within the framework of Cool Earth Partnership Initiative. In the Congo Basin, Cameroon, the Republic of Congo and Gabon are currently participating. Under this program, UNDP will assist countries in implementing integrated and comprehensive adaptation actions and resilience plans. The projects will ensure that national development processes incorporate climate change risks and opportunities to secure development gains under a changing climate. UNDP will help countries establish an enabling environment and

Table 3. National adaptation initiatives.

Countries	Adaptation program	Sectors
Republic of Congo	Supporting integrated and Comprehensive Approaches to Climate Change Adaptation in Africa – Republic of Congo (Brazzaville)	Forestry Energy Coastal zone management
Cameroon	Supporting Integrated and Comprehensive Approaches to Climate Change Adaptation in Africa – Cameroon	Coastal zone management Energy Health Agriculture
Gabon	Supporting Integrated and Comprehensive Approaches to Climate Change Adaptation in Africa – Gabon	Coastal zone management
DRC	Building the Capacity of the Agriculture Sector in DRC to Plan for and Respond to the Additional Threats Posed by Climate Change on Food Production and Security	Agriculture/food security
CAR	Integrated Adaptation Program to Combat the Effects of Climate Change on Agricultural Production and Food Security in Central African Republic	Agriculture/food security
Cameroon	Water, Climate and Development Programme in Africa	Water management
Equatorial Guinea	National Action Programme of Adaptation to Climate Change	Infrastructure Water resources (watershed and flood management) Health Fisheries Agriculture Forestry Energy
Regional (Cameroon, DRC and CAR)	CCAA research and capacity development program	Various
Cameroon (among eight countries)	Water, Climate and Development Programme in Africa	Water
Regional (21 countries including Cameroon, Republic of Congo and Gabon)	AAP	Various

develop the capacity required to design, finance, implement and monitor long-term and cost-effective adaptation policies and plans.

- **Climate Change Adaptation in Africa (CCAA).** The CCAA program sought to improve the ability of African countries to adapt to climate change in ways that benefit the most vulnerable. It aimed to strengthen capacities of researchers, institutions, decision-makers and other actors in the African continent. It operated in three

countries in the Congo Basin, namely Cameroon, CAR and DRC, and ended in 2012.

Table 3 presents the national adaptation programs developed in each country. Most of them aim to frame national policies, with a strong focus on capacity building. In most countries agricultural and coastal management are priorities whereas forestry is rarely a national focus for adaptation.

Table 4. Priority sectors identified in national official documents on adaptation and mitigation.

Country	Adaptation	Mitigation
DRC	Water resources and watershed management Agriculture Forestry (LULUCF) Coastal zone management Health	Forestry (LULUCF) Agriculture Waste management Energy (industrial processes)
CAR	Agriculture Energy (biomass and hydropower) Forestry (forestry production)	Forestry (LULUCF)
Cameroon	Coastal zone management (infrastructure and mangroves) Biodiversity and aquatic resources Water resources (watershed and flood management) Health	Forestry (LULUCF, biomass and soil) Waste management Agriculture (rice, cattle and fertilizer) Energy (biomass, hydropower and energy efficiency) Industry
Republic of Congo	Agriculture Forestry Urban area Health	Energy (biomass, oil, hydropower and solar) Forestry (LULUCF)
Gabon	Coastal zone management (infrastructure and ecosystems) Health	Energy (hydropower and solar)
Equatorial Guinea	Infrastructure Water resources (watershed and flood management) Health Fisheries Agriculture Forestry Energy	Forestry (LULUCF, biomass and soil) Agriculture

Note: LULUCF = Land use, land-use change and forestry.

Demonstration of adaptation activities

Only four adaptation projects were identified. Table 3 presents examples of past and on-going projects with clear adaptation objectives. The list is not exhaustive but is representative of the under-engagement in adaptation to climate change (see Annex 4 for more details on each project).

As stated previously, NAPAs constitute an initial step for developing countries to develop adaptation projects. However, few of them have been financed and implemented to date. For example, none of them

have been submitted to the Adaptation Fund¹ of the Kyoto protocol. This reveals an under-use of possible available funding. Table 4 presents the adaptation projects identified in the NAPAs and their main

¹ The Adaptation Fund was established to finance concrete adaptation projects and programs in developing countries that are Parties to the Kyoto Protocol and are particularly vulnerable to the adverse effects of climate change. The Adaptation Fund is financed by a share of proceeds from the Clean Development Mechanism as well as other sources of funding. The share of proceeds amounts to 2% of certified emission reductions issued for a Clean Development Mechanism project activity.

sectors of focus. In contrast to the national level, the forest sector is receiving considerable attention.

From the analysis we can draw two main observations. First, there is a lack of data on whether traditional development or environmental projects respond to climatic stresses or incorporate climatic issues. Second, adaptation to climate change is rarely the main focus of development and environmental programs and is rather seen as an additional component.

The main approach for adaptation is based on agricultural improvements, conservation of ecosystems (e.g. networks of protected areas of mangroves), rehabilitation of degraded zones, and reforestation (e.g. green belt against erosion). Most of the activities support local institutions, public awareness campaigns aimed at local populations and decision makers, partnerships with local NGOs, and revision of legal procedures.

In addition, a number of networks or global initiatives exist in Africa but are not specific to the Congo Basin. They have been active in the domain

of disaster risk reduction and capacity building. They are the result of collaboration of multiple networks and are mainly focused on dissemination of information rather than implementation. For example, networks such as the African Center of Meteorological Application for Development, AGRHYMET, the Center for International Earth Science Information Network, and the Famine Early Warning System Network provide useful information on climatic data, impacts of climate change and food security. A few other networks are focused on genetic improvement for agriculture, with consideration of climate-resistant varieties. These are mainly research networks such as African Agricultural Technology Foundation, Association for Strengthening Agricultural Research in Eastern and Central Africa, Annual Steering Committee Meeting of the Eastern and Central Africa Bean Research Network, and World Agroforestry Centre (see Annex 5 for a full list of these networks). However, in the countries of the Congo Basin we note a relatively weak presence of these networks in supporting activities in the domains of vulnerability assessment, capacity building, coastal management and local demonstration projects.

3 Potential for synergies between adaptation and mitigation

Synergies in global frameworks and policy processes

Adaptation and mitigation actions can only be effective when mainstreamed into actual policies and a broader framework. When analyzing the types of activity implemented in readiness and national programs for REDD+ or adaptation to climate change (Figure 7), it appears that the two are going through similar processes.

The key challenge in climate policy is to build capacity and facilitate action. Hence, considerable effort is deployed to build national and regional capacity in both adaptation and REDD+. Other means of facilitating governments' efforts to incorporate climate change considerations into planning and policy making include:

- creation of new institutions or institutional support (the same actors can be involved in both processes)
- advocacy for policy reforms in agriculture, forestry and energy — adaptation and REDD+ need policy reforms in the same sectors (see Table 4)

- monitoring of data — both adaptation and REDD+ need updated information on the state of natural resources and the environment.

Many opportunities for synergies exist between REDD+ and adaptation processes, and a joint approach could improve the efficiency of policy processes and high-level planning. Among readiness activities, only three mention possible synergies to harmonize policies. In particular, Gabon has developed a national climate plan integrating both REDD+ and adaptation in its design. However, in the Congo Basin countries there is still a lack of recognition of synergies in national frameworks and strategies. This is mainly justified by the fact that accomplishing mitigation and adaptation goals simultaneously presents many challenges. First, it can increase institutional complexity; institutions around REDD+ are already complex and capacities are already lacking. Second, the funding layout does not allow for synergies; multi-focus funding is uncommon and most funding is oriented toward one objective. Finally, often relevant information is not

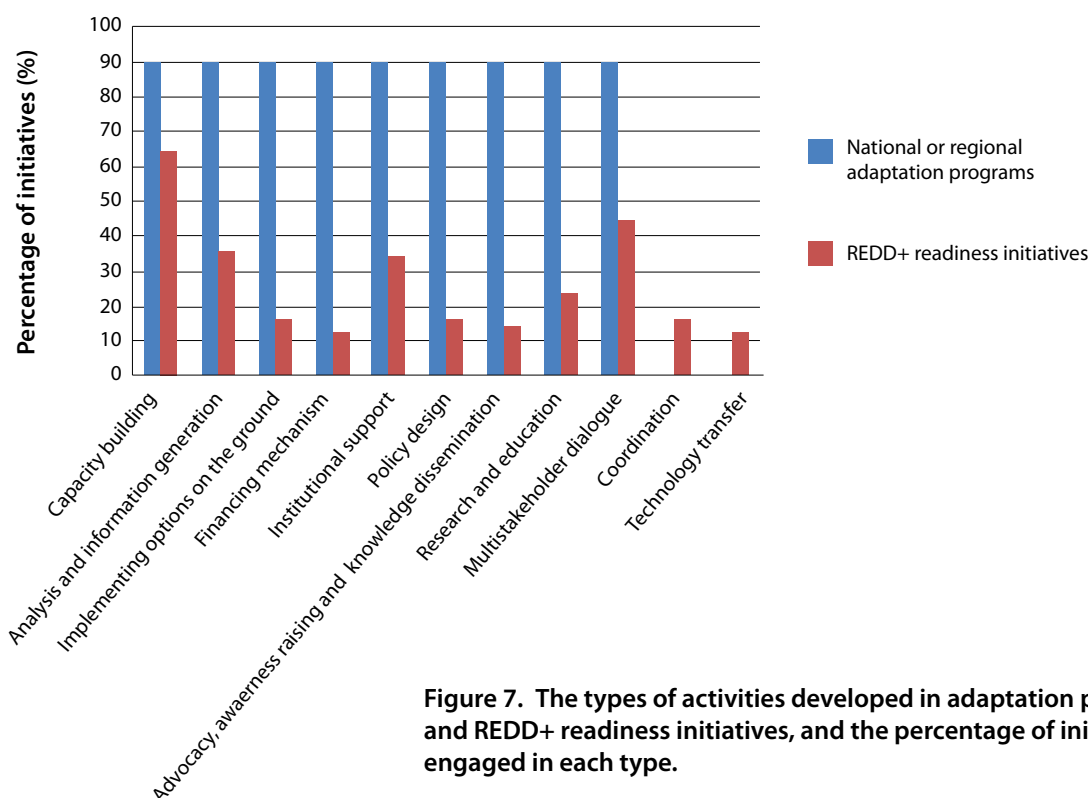

Figure 7. The types of activities developed in adaptation programs and REDD+ readiness initiatives, and the percentage of initiatives engaged in each type.

available at the same time, as exemplified by the long time period to develop adaptation strategies.

Synergies in demonstration projects

Local demonstration activities (REDD+ or adaptation) are implementing a great variety of interventions as summarized in Figure 6. The analysis suggests that demonstration projects present many similarities in their approach, which relates to a historical development and conservation approach. The first main set of interventions in REDD+ and adaptation projects concern integrated forest conservation and sustainable forest management. Some of the identified REDD+ projects aim to reduce access to forests and thus limit pressures on them, whereas adaptation projects aim to improve or preserve forest capacity for resilience and delivery of ecosystem services. Some examples of activities are participatory land planning, reforestation, extension of protected areas, and low impact or forest logging. Both adaptation and mitigation processes rely on common existing frameworks. For instance, support to community forests is identified in both REDD+ projects and adaptation projects in NAPAs. However, projects on sustainable forest management for adaptation are still at the planning stage and are not yet implemented or funded. One possible reason for this is that less attention has been given to quantifying the impact of climate change on forests than in other sectors such as agriculture, where adaptation appears to be a priority.

Another set of common interventions combines alternative livelihoods and traditional development projects. These activities are mainly focused on the agricultural sector (e.g. improved farming techniques and improved crop varieties) and diversifying sources of revenue. The analysis highlights that there are specific activities common to both REDD+ and adaptation projects such as the promotion of non-timber forest products and agroforestry. The main rationale is that agroforestry reduces the vulnerability of crop production to climate change, maintains soil fertility, reduces soil erosion and is compatible with the maintenance of forest cover and carbon stocks.

However, a few distinctions can be made between REDD+ projects and adaptation projects. REDD+ projects use a performance-based payment approach with payment conditional to the successful protection or improvement of carbon stocks in local forests. In contrast, adaptation projects usually promote direct investments, insurances or incentives, rather than performance-based payments, which are

more difficult to implement. This is partially because benefits of adaptation are difficult to express in a single metric. However, there are very few examples of performance-based payments in the Congo Basin and those that do exist are at an early stage. Another important distinction between REDD+ and adaptation projects is that REDD+ projects tend to develop a whole set of interventions that jointly target many sectors (e.g. forest exploitation, agriculture, conservation and infrastructure) whereas adaptation projects mostly focus on one or two sectors. Finally, adaptation interventions sometimes take place in sectors that are not typically involved in REDD+ projects such as health and water management.

Some projects have expressed more explicitly the potential for synergies (see Table 5). Most combine the protection or management of forests with improved land use and watershed management, nature conservation, and agroforestry. For example, agroforestry presents many opportunities in which the multiple objectives of food production, ecosystem services delivery, biodiversity conservation and carbon sequestration could be integrated with long-term livelihood security.

Emergence of hybrid approaches

Most REDD+ and adaptation projects aim to combine the integrated conservation and development project ICDP approach with PES (Sunderlin and Sills 2012). However, the hybrid structure of these projects reveals the lack of a clear framework for designing successful climate change projects. On the other hand, the hybrid structure allows for opportunities to overcome potential barriers. For example:

- **Repackaging of on-going efforts.** This enables project holders to build on existing efforts and progress. Incorporating carbon or climate objectives into existing projects constitutes incremental progress rather than abrupt transformation that might increase risk of failure.
- **Reducing uncertainties and risks.** ICDP projects ensure predictable benefits. “Under conditions of REDD+ policy and market uncertainty..., it makes sense to diversify forest management strategies” (Sunderlin and Sills 2012, 183). Projects are waiting for clearer signals from policy and market deals. For adaptation, proponents are also waiting for clearer messages about future impacts of climate change. In the adaptation domain, the recommended approach is the “no regret approach” and to minimize the risk of

Table 5. Explicit synergies between REDD+ projects and adaptation.

Expected benefits from REDD+ projects	Rational and links with adaptation goals
Watershed protection Environmental benefits	The protection of forests will secure vital watersheds. REDD+ activities will reduce soil erosion, mitigate water loss from runoff, avoid bush fires and their associated negative impacts on soils and ecosystems, and prevent and mitigate the negative impacts of key threats to protected areas.
Improved local capacities and alternative incomes	Alternative employment (e.g. working in forest management or in tree nurseries) could introduce long-term income enhancement mechanisms for local communities and encourage entrepreneurship. REDD+ activities will also support local communities to manage their forest in a sustainable way.
Improved agricultural productivity and resilience Adoption of good practices	An integrated management system at the farm scale, improved farming techniques and agroforestry plantation. Adoption of good practices by the local administration for land management (agricultural and forestry). This allows for better planning.
Infrastructure and roads	Improved access to and from villages, new opportunities through better access to markets and improved access to water sources.

maladaptation. Historical approaches can be seen as a no regret approach under climate projection uncertainties.

- **Responding to the fragmentation of finance opportunities.** REDD+ promises long-term funding whereas adaptation funds generally provide short-term funding for the early implementation of projects.

In sum, hybrid approaches present potential for synergies between adaptation and mitigation. Nevertheless these emerging hybrid approaches also present challenges and risks including:

- replicating errors of past development projects (these errors have been largely documented)

- not addressing vulnerabilities of local communities to future stresses. The main risk is a diversion of funds for other objectives and failure to fully consider future climatic stresses. For example, efforts to create new economic growth might create new vulnerabilities or new pressures on forests
- ineffective integration; there exists potential for synergies yet there are very few planned and explicit integrations
- not promoting an integrative approach that embraces the complexity of vulnerability of local populations. The current layout of funding supports sector-specific adaptations rather than societal adaptation that could bring about more benefits.

4 Conclusion

The analysis of adaptation and mitigation projects and initiatives in the Congo Basin reveals some insight into the barriers encountered by national institutions, multilateral and bilateral partners, decision makers and implementers. The emerging landscape of climate change projects is complex with projects at different stages of implementation. Most of the projects are at an early stage with more emphasis on REDD+ than on adaptation due to uncertainties about spatio-temporal patterns of risk occurrence and lack of clear adaptation solutions. Other explanations are linked to insufficient political support or negligence of the issue amongst project managers. Adaptation to climate change is a rather diffuse objective in the development approach and does not benefit from a national framework as REDD+ does. Priorities and progress vary between

countries. While the energy sector is one of the major priorities in all countries of the Congo Basin, the role of the forestry sector in adaptation has not been fully recognized.

REDD+ and adaptation to climate change have evolved as two parallel processes although they present many similarities in nature. Potential for synergies between the two processes exists but is not fully acknowledged yet. Therefore, transformational changes are needed to fully integrate adaptation and mitigation in the current framework of climate portfolios. There is a need for tools, information and knowledge to support decision makers in harmonizing climate policies. One of the priorities is a better quantification of trade-offs between population adaptation and carbon objectives.

Country	Project title	Objectives	Activities	Leading Institution	Other partners	Financing	Status	Carbon valorization/compensation
Region (Cameroon, Republic of Congo)	Enhancement forestry waste in Central Africa and reforestation of degraded systems in Central Africa	To slow down deforestation (by returning the rate of rebus forester of 75% today to 25% at the end of the project) and to improve the living conditions of the local populations by the marketing of products stemming from the exploitation of rebus, from agroforestry and development of socioeconomic infrastructure	Marketing of products stemming from the exploitation of rebus Local management comity Development of sedentary agriculture Restoration of degraded land (agroforestry and plantation) Socioeconomic infrastructures	Global Water Partnership Central Africa (GWP)		CBFF (GBP 1.5 million)	Approved, start in 2012	
Other example of mitigation project								
DRC	CONSAVA project	The main objective is to increase thermal efficiency through CONSAVA stove use, forest conservation through reduced consumption of wood energy and saving of firewood by 60% compared to the traditional stove	Dissemination of improved stoves	Société TAICOM Congo

Country	Project title	Objectives	Activities	Leading Institution	Other partners	Financing	Status	Carbon valorization/compensation
DRC	Phasing out slash-and-burn farming with bio-char	Replacing slash-and-burn farming with a system that uses bio-char aims to solve four pressing problems simultaneously through its projects: bio-char will improve soil fertility, sequester carbon, phase out slash-and-burn farming and yield renewable energy	Farming improvement Energy activities aimed at optimizing the co-generation of bio-char and energy	ADAPEL	Bio-char fund	CBFF (GBP 338,000)	Ongoing since 2009. No credit yet sold	Carbon credit: Voluntary market
DRC	<i>Jatropha curcas</i> cultivation in the Democratic Republic of Congo	The intended objectives of this project are the sequestration of carbon dioxide by the cultivation of <i>Jatropha curcas</i> , regeneration of degraded soils and protection of soils against erosion, empowerment of local communities to develop sustainable agro-forestry practices, and provision of an alternate livelihood potential for local communities	Planting 14,000 hectares of <i>Jatropha</i> production of biodiesel fuel Other agricultural activities by adopting an intercropping farming method	OGEC BioDeC		Carbon2Green (C2G, sale of carbon credits)		CDM project
DRC	Congo Kilwit reforestation		Reforestation	PrimaKlima-Weltweit			In progress	Carbon credit: Voluntary carbon market, No standard for the moment

Annex 3. Continued

Countries	Programme	Sectors	Domain	Leading Institution	Other partners	Financing	Duration
DRC	Building the capacity of the agriculture sector in DR Congo to plan for and respond to the additional threats posed by climate change on food production and security	Agriculture/ food security	Capacity building Project development Consultation Financing mechanism	UNDP	Ministère de l'Environnement, Conservation de la Nature, Eaux et Forêts	USD 3.410 million GEF and PNUD (LDCF)	5 years (2010–2015)
CAR	Integrated Adaptation Programme to Combat the Effects of Climate Change on Agricultural Production and Food Security in Central African Republic	Agriculture/ food security	Policy (design and implementation) Implementing adaptation option Knowledge dissemination	UNDP	Ministry of Agriculture and Ministry of Environment	USD 3.058 million GEF (LDCF)	5 years (2011–2016)
Cameroon	Water, climate and Development programme (WCDDP) in Africa	Water management	Policy development Capacity building Institutional framework Financing mechanisms	CRDI	Multiples (CIFOR, Universities...)	CAD 16.25 million from IDRC, and GBP 25.25 million from DFID	5 years extended (2006–2012)
Regional (Cameroon DRC CAR)	Programme Adaptation aux changements climatiques en Afrique (ACCA) par la recherche et le renforcement des capacités	Various	Research programme Capacity building Policy development	Global Water Partnership, African Ministers Council on Water (AMCOW)	Governments, Regional Economic Communities (RECs) and River Basin Organisations	EUR 12.7 million GWP's Financing Partners	3 years (2010–2013)

Annex 4. Local adaptation projects

Country	Project name	Sector	Domain	Leading Institution	Other partners	Targets	Financing
Regional (Cameroon, DRC, CAR)	Altering the climate of poverty under climate change in sub-Saharan Africa: Setting priorities and strategies for adaptation with the forests to climate change	Forest	Capacity building	CIFOR	UNIKISS, Université de Bangui.	Decision makers and managers	DFID-IDRC
Cameroon	Global climate change and socioeconomic impact on Cameroon: Examining the Risks and adaptive strategies of agrarian households	Agriculture/food security	Research / Evaluation	WWF/ WCS	GEF/UNEP CWCS, MINEP, MINFOF, Cameroon Mangrove Network (CMN), Université de Buea, UYI	Local ONG Local Populations	GEF/ UNEP
Cameroon	Mangrove resilience assessment and adoption to climate change project	Mangrove	Research / Evaluation	ENDA University of Buea		Rural Farming Local Populations	DFID-IDRC
DRC	JENGA JAMAA project	Agriculture/food security	Development	Africacare Andra		Local communities	USAID

Annex 5. Networks, programs or organizations acting in domains linked to adaptation to climate change in Africa

The following networks either cover the whole Congo Basin or are present in one of its countries.

AATF (African Agricultural Technology Foundation) facilitates and promotes public–private partnerships for the access and delivery of appropriate agricultural technologies for sustainable use by smallholder farmers in sub-Saharan Africa through innovative partnerships and effective stewardship along the entire value chain. It is active in the domain of technological transfer and crop breeding. (Source: <http://www.aatf-africa.org>)

ACMAD (African Centre of Meteorological Application for Development) is the Weather and Climate Centre with African continental competence. ACMAD's mission is the provision of weather and climate information and for the promotion of sustainable development of Africa (notably within the context of national strategies for poverty eradication), in the fields of agriculture, water resources, health, public safety and renewable energy. (Source: <http://www.acmad.ne/en/homepage.htm>)

AGRHYMET is a specialized institute of the Permanent Interstate Committee for Drought Control in the Sahel (CILSS) composed of nine member States. It focuses on dissemination of agro-meteorological data to reduce vulnerability to current climate variability of farmers (Source: <http://www.agrhymet.ne/>)

ASARECA (Association for Strengthening Agricultural Research in Eastern and Central Africa) aims to enhance sustainable productivity, value added and competitiveness of the sub-regional agricultural system. It is working on improved varieties that are less sensitive to climatic stresses (Source: <http://www.asareca.org/>)

ACCCA (Advancing Capacity to Support Climate Change Adaptation) support effective adaptation decisions to reduce vulnerability to climate change.

It draws on lessons learned about communicating climate risk information in clear terms that are relevant to decision-makers; addressing climate risks and adaptation in an integrated, multidisciplinary way; the importance of engaging stakeholders substantively; and the long-term benefits of partnering institutions from scientific and policy communities for understanding and managing climate change risks. (Source: <http://www.acccaproject.org/accca>)

ATPS (African Technology Policy Studies Network) The ATPS is a multidisciplinary network of researchers, practitioners and policy makers that promotes science, technology and innovation policy research, dialogue and practice, for African Development. It considers climate change issues through the lens of integrated water management and innovation of adaptation in agriculture. (Source: <http://www.atpsnet.org>)

CIESIN (Center for International Earth Science Information Network) provides information resources on many topics related to the earth and its environment, in particular on the effect of climate change in Africa. (Source: <http://www.ciesin.columbia.edu/>)

ECABREN (East and Central Africa Bean Research Network) is a network that brings together universities, NGOs and the private sector as well as government research and development (R&D) institutions to share bean germplasm and information and expertise in the area of bean breeding and dissemination. (Source: <http://www.ecabren.org>)

FEWSNET (Famine Early Warning System Network) is a leading provider of information and analysis on food insecurity. It provides an information system to identify problems in the food supply system. (Source: <http://www.fews.net/Pages/default.aspx>)

ICRAF (World Agroforestry Research Center) has a dedicated research program on improvement of cash crops, management of water resources, land-use planning, and improved resilience of agricultural systems. (Source: <http://www.worldagroforestry.org>)

ODINAFRICA (Ocean Data and Information Network for Africa) brings together more than 40

marine related institutions from 25 countries in Africa. The network strives to address the challenges faced in ensuring that ocean and coastal data and information generated in national, regional and global programmes are readily available to a wide range of users in an easily understandable format. (Source: <http://www.odinafrica.org>)

CIFOR Working Papers contain preliminary or advance research results on tropical forest issues that need to be published in a timely manner to inform and promote discussion. This content has been internally reviewed but has not undergone external peer review.

This report presents the state of progress of projects and initiatives to promote adaptation and REDD+ in the Congo Basin region and it analyses opportunities for synergies or trade-off between the two strategies. 94 national programs and activities on the ground related to REDD+ and 11 on adaptation have been identified in six countries of the Congo Basin.

The emerging landscape of climate change projects is quite complex and is mainly rooted in historical approaches. Opportunities for funding exists but are not seized; most of the projects are at an early stage with more emphasize on REDD+ than on adaptation, due to uncertainties about spatiotemporal patterns of risk occurrence, lack of clear adaptation solutions. Some other reasons are linked to insufficient political support or lack of interest for the issue amongst project managers. Adaptation to climate change is rather diffuse in development approach and does not benefit of national structuring framework as REDD+ does.

Among REDD+ initiatives, there are 1) local demonstration activities that directly aim to reduce carbon emission from deforestation, forest degradation, and sustainable forest management and increase carbon stocks, and 2) readiness activities that try to create an enabling framework for countries to participate in REDD+ deals and develop strategies accordingly. Adaptation to climate change and REDD+ evolves as two parallel and similar processes. Potential for synergies among the two processes exists but are not fully recognized yet. Thus transformational changes are needed to increase the integration of adaptation and mitigation in the current climate portfolio. In particular, there is a need for tools, information and knowledge to support decision makers to harmonizing climate policies.

RESEARCH PROGRAM ON
Forests, Trees and
Agroforestry

This research was carried out by CIFOR as part of the CGIAR Research Program on Forests, Trees and Agroforestry (CRP-FTA). This collaborative program aims to enhance the management and use of forests, agroforestry and tree genetic resources across the landscape from forests to farms. CIFOR leads CRP-FTA in partnership with Bioversity International, CATIE, CIRAD, the International Center for Tropical Agriculture and the World Agroforestry Centre.

Fund

Center for International Forestry Research (CIFOR)

CIFOR advances human well-being, environmental conservation and equity by conducting research to help shape policies and practices that affect forests in developing countries. CIFOR is a member of the CGIAR Consortium. Our headquarters are in Bogor, Indonesia, with offices in Asia, Africa and Latin America.
