

Thematic Working Group on Knowledge Services

Stakeholders need to discover, understand, and use a growing amount of information to optimise climate actions. However, efficient knowledge sharing is challenging, and misinformation further aggravates the issue, causing a lack of trust in science and institutions.

To combat this, trusted knowledge services and applications are necessary with curated, easily accessible information on climate change.

MAIA is exploring the possibility of establishing a Cluster Group on this topic. The Group would comprise representatives of climate research projects and initiatives beyond Europe and selected counterparts from European projects.

The intention is to provide a new space for open exchange and friendly interaction to uncover opportunities for learning and exchange. Particularly on how certain climate research and policy aspects might be perceived, handled, and/or prioritised differently in other regions of the world.
